presents a guide to human anatomy and its depiction in art with advice on drawing various poses and motions

the objective of this book is to describe techniques to investigate the behaviour of electric fields and induced currents in the human body exposed to different scenarios of extremely low frequency elf high voltage low current electromagnetic

fields by means of numerical modelling with improved boundary element methods. A variety of three dimensional anatomically shaped human body models under different exposure conditions are presented and solved. The mathematical formulation for the case of human exposure to ELF electromagnetic fields departing from Maxwell equations and for the electrical properties of biological tissue is provided. The underpinning ideas of the boundary element method applied to ELF fields in the human body are presented. A literature survey including electrical properties of tissues relevant to low frequency calculations has been compiled and included in one chapter. A novel improved BEM approach is introduced in order to solve this type of problems leading to more accurate results and more efficient calculations. The developed methodology is applied to three different case studies: i) overhead power transmission lines ii) power substation rooms and iii) pregnant woman including foetus and evolving scenarios. In all the cases a sensitivity analysis investigating the influence of varying geometrical and electrical properties of the tissues has been conducted. The results obtained allow to identify situations of high and low exposure in the different parts of the body and to compare with existing exposure guidelines.

This edited book explores digital visualization as a tool to communicate complex and often challenging biomedical content in an accessible and engaging way. The reader will learn how current visualization technology can be applied to a wide range of biomedical fields to benefit the learning of students and enhance the public understanding of science. The focus of this volume will be on the innovative use of digital visualization 2D or 3D in biomedical education and public engagement. This includes medical imaging i.e. magnetic resonance imaging and computed tomography as well as other digital imaging techniques such as laser scanning. It also covers the use of state of the art visualization tools i.e. augmented and virtual reality animations and 3D printing and the integration of 3D models of anatomical structures into serious computer games. This book will appeal to educators, researchers and students in life science subjects as well as to healthcare professionals and designers of digital learning resources. The book will be a source of inspiration for any reader who is interested in using digital visualization as a meaningful and engaging communication tool for biomedical content ranging from the anatomy and function of organs to the mechanisms of diseases and their prevention.
