this book explores the latest advances in algebraic structures and applications and focuses on mathematical concepts methods structures problems algorithms and computational methods important in the natural sciences engineering and modern technologies in particular it features mathematical methods and models of non commutative and non associative algebras hom algebra structures generalizations of differential calculus quantum deformations of algebras lie algebras and their generalizations semi groups and groups constructive algebra matrix analysis and its interplay with topology knot theory dynamical systems functional

analysis stochastic processes perturbation analysis of markov chains and applications in network analysis financial mathematics and engineering mathematics the book addresses both theory and applications which are illustrated with a wealth of ideas proofs and examples to help readers understand the material and develop new mathematical methods and concepts of their own the high quality chapters share a wealth of new methods and results review cutting edge research and discuss open problems and directions for future research taken together they offer a source of inspiration for a broad range of researchers and research students whose work involves algebraic structures and their applications probability theory and mathematical statistics applied mathematics engineering mathematics and related areas

this volume emphasizes the role of effective curriculum design teaching materials and pedagogy to foster algebra structure sense at different educational levels positing algebra structure sense as fundamental to developing students broader mathematical maturity and advanced thinking this text reviews conceptual historical cognitive and semiotic factors which influence the acquisition of algebra structure sense it provides empirical evidence to demonstrate the feasibility of linking algebra structure sense to technological tools and promoting it amongst diverse learners didactic approaches include the use of adaptive digital environments gamification diagnostic and monitoring tools as well as exercises and algebraic sequences of varied complexity advocating for a focus on both intuitive and formal knowledge this volume will be of interest to students scholars and researchers with an interest in educational research as well as mathematics education and numeracy

this book describes two stages in the historical development of the notion of mathematical structures first it traces its rise in the context of algebra from the mid 1800s to 1930 and then considers attempts to formulate elaborate theories after 1930 aimed at elucidating from a purely mathematical perspective the precise meaning of this idea

this volume is a result of a meeting which took place in june 1986 at Il ciocco in italy entitled deformation theory of algebras and structures and applications it appears somewhat later than is perhaps desirable for a volume resulting from a summer school in return it contains a good many results which were not yet available at the time of the meeting in particular it is now abundantly clear that the deformation theory of algebras is indeed central to the whole philosophy of deformations perturbations stability this is one of the main results of the 254 page paper below practically a book in itself by gerstenhaber and shack entitled algebraic cohomology and deformation theory two of the main philosophical methodological pillars on which deformation theory rests are the following pure to study a highly complicated object it

is fruitful to study the ways in which it can arise as a limit of a family of simpler objects the unraveling of complicated structures applied if a mathematical model is to be applied to the real world there will usually be such things as coefficients which are imperfectly known thus it is important to know how the behaviour of a model changes as it is perturbed deformed
